

**NED UNIVERSITY OF ENGINEERING & TECHNOLOGY**  
Centre for Multidisciplinary Postgraduate Programmes (CMPP) – NED Academy  
Postgraduate Diploma in Data Science with Artificial Intelligence - Batch 10

Final Examination – Spring-I-2025

Course: Python

Time: 3 Hours

Max. Marks: 60

**Instructions:**

- i. Attempt all questions
- ii. Marks for each question are given.
- iii. You are required to abide by all rules and regulations set for the examination by the NED Academy.
- iv. Total time of examination is 3 hours. No extra time will be provided after the time is over.

S. No.	Question	Marks
1.	<p><b>OOP – Class Methods</b></p> <p>Create a Python class named <i>Book</i> that has attributes for <i>title</i>, <i>author</i>, and <i>publication_year</i>. Implement the following methods:</p> <ul style="list-style-type: none"><li>• <code>__init__</code>: Initialize the attributes.</li><li>• <code>__repr__</code>: Return a clear, formatted string representation of the object.</li><li>• <code>__call__</code>: When an instance is called with a new publication year, update the <i>publication_year</i> attribute.</li></ul> <p>Provide example usage and explain the role of each method.</p>	12
2.	<p><b>File Handling – Reading and Seeking</b></p> <p>Write a Python script that does the following:</p> <ul style="list-style-type: none"><li>• Opens a text file using the <i>with open</i> statement.</li><li>• Reads the first 100 characters of the file.</li><li>• Uses the <i>seek()</i> method to return to the beginning of the file.</li><li>• Reads and prints the entire file content.</li></ul> <p>Explain the importance of using <i>with open</i> and how the <i>seek()</i> method affects file reading.</p>	12
3.	<p><b>Functions – Recursion, Decorators, and Lambda</b></p> <p>a. Implement a recursive function to calculate the <i>nth</i> Fibonacci number.</p>	12

	<p><i>b. Create a decorator that logs the function's input and output each time the Fibonacci function is called.</i></p> <p><i>c. Write a lambda function that takes a list of numbers and sorts them in ascending order.</i></p> <p><i>Provide explanations on how recursion works, the benefit of using decorators for logging, and why lambda functions can be useful in such contexts.</i></p>	
4.	<p><b>Data Types – Lists, Dictionaries, Tuples, and Sets</b></p> <p><i>Design a Python program that stores student records, where each record consists of a student's name and grade, using different data structures:</i></p> <ul style="list-style-type: none"> <li><i>• A list for an ordered collection of student names.</i></li> <li><i>• A dictionary mapping student names to their grades.</i></li> <li><i>• A tuple representing an immutable student record.</i></li> <li><i>• A set for a collection of unique student names.</i></li> </ul> <p><i>Demonstrate key operations (such as adding, updating, retrieving, and deleting elements) for each data structure, and discuss the strengths and weaknesses of each type.</i></p>	12
5.	<p><b>f-Strings – Advanced Formatting</b></p> <p><i>Given a list of products where each product includes a name, price, and release date, write a Python program that uses advanced f-string formatting to print a neatly aligned table of product information.</i></p> <ul style="list-style-type: none"> <li><i>• Format the price as currency (e.g., with two decimal places and a dollar sign).</i></li> <li><i>• Display the release date in a human-readable format (e.g., "Jan 01, 2025").</i></li> </ul> <p><i>Explain how f-strings improve code readability and formatting precision.</i></p>	12
